

CMEE Masters: Computing Coursework Assessment

Assignment Objectives: To work on a series of computing/programming exercises and problems in a coherent, modular, reproducible workflow under version control.

Note that:

- *All script/code files, errors and other info mentioned below are in the weekly log/feedback files.*
- *The overall assessment will typically have significantly lesser marks than a simple weighted average of each week's points because the overall assessment is based on not just the "Computing Coursework Assessment Criteria", but also the the "Marking Criteria for Exams, Essays and Coursework". Both sets of marking criteria are in the Assessment Appendix of the online TheMulQuaBio notes and git repository.*
- *In your 1:1 post-assessment feedback session, we will discuss where you gained or lost marks, and what you could have improved further. To the extent possible, please come with questions about specific scripts based upon the overall and weekly feedback you have received. This may require you to compare your code with the solution code in many cases.*

Student's Name: Wenhua Zhou

1 Specific feedback

1.1 The Good (what you did well!)

1. Found all the expected weekly directories in your parent directory.
2. Reasonably clean project organization and code
3. Your Git repo size when I last checked was about 32 MB — an good size, suggesting you did not keep unnecessary binary files under VC, and that you did not commit excessively. It could also mean that you did not commit enough, and/or somehow along the the way lost parts of your git history — but I won't check these possibilities!
4. Good job with the coding overall (with some caveats - see below). You made great progress over the 9 weeks.
5. You did all extra credit Qs - fantastic!
6. Scripts from Weeks 4, 5 & 6 were not part of the assessment. You tried to keep these weeks well organized but not sufficiently; you were missing tt code in Week 4, for example.
7. Nice job with the temperature Autocorrelation practical code and report. You could have plotted the correlation pattern, and also mark the empirically-observed coefficient on the the histogram of the permuted correlation coefficients. Some more interpretation of the results would have been nice.

1.2 The Bad (errors, missing files, etc)

1. There were some syntax and path specification errors that could have been fixed easily.

1.3 The Ugly (niggling issues like commenting, cosmetics, complexity of code, etc)

1. You had an overall readme file, but nothing particularly useful in it (e.g., a description of what the overall project structure is).
2. You had a Readme within each week as expected. The weekly Readmes could have been better structured. More focus on the code usage than Chapters being taught.
3. In these readmes you could have included the language and dependencies requirements. Also check out this resource: <https://github.com/jehna/readme-best-practices>. As you become a seasoned programmer, you will learn to make the readme file descriptions even more informative yet succinct.
4. You had a .gitignore throughout, without meaningful exclusions specific to certain weeks. You will likely find this useful: <https://www.gitignore.io>.
5. In many places, especially early weeks (e.g., UNIX), you could have broken the description of certain complex commands or code lines into key components using a comment.
6. For shell scripts, in general, it is a good idea to add some input checks and return a meaningful message with error for utility scripts like these, especially in case somebody else uses it. I had not asked for these explicitly, but was hoping this would be something you would arrive at yourself after gaining some experience with coding and revisiting your code. But most students don't get to this, so don't feel too bad!
7. Also, in as many cases as possible, it is a good idea to write scripts to be self-sufficient (modularize your code). For example, `align_seqs.py` was nicely done, but it could have been written to be a module also take external inputs optionally (though I did not ask for it specifically). Compare with the solution.
8. Please do compare as many of your solutions with the ones I have given (e.g., `Unix-Prac1.txt`, `using_os.py`) as possible. There are simpler ways to solve some of them, especially the last one, and in general it will be insightful to see how the same code/solution can be written/found. In particular:
 - (a) `using_os.py`: the script could have provided some more meaningful output to screen.
 - (b) You did a great job with `lc1.py`, `lc2.py`, `dictionary.py`, and `tuple.py`, but if you compare with the solutions on the repo, you will notice that you could have made them produce better-formatted output.

2 Overall Assessment

You did a good job overall! As this is the first time you have done programming in a heady mix of UNIX, Python, & R with a sprinkling of L^AT_EX and git, you did very, very well!

It was a tough set of weeks, but I believe your hard work in them has given you a great start towards further training, a quantitative masters dissertation, and ultimately a career in quantitative biology!

Provisional Mark: 81
